To the reader

This codebook is part of the data FSD2465 archived at the FSD (Finnish Social Science Data Archive). The dataset has been described in as much detail as possible in Finnish and English. Variable frequencies, variable and value labels, and missing values have been checked. If necessary, the data have been anonymised. The data and its creators shall be cited in all publications and presentations for which the data have been used. The bibliographic citation may be in the form suggested by the archive or in the form required by the publication. The bibliographic citation suggested by the archive:

The user shall notify the archive of all publications where she or he has used the data. The original data creators and the archive bear no responsibility for any results or interpretations arising from the reuse of the data.

The codebook contains information on data content, structure and data collection, and includes a list of publications wholly or in part based on the data, according to publication information received by the FSD. The second part of the codebook contains information on variables: question texts, response options, and frequencies. The third part contains indexes.

Variable distributions presented in this codebook have been generated from the SPSS files. Distribution tables present variable values, frequencies (n), frequency percentages (%), and valid percentages (v. %) which take into account missing data. All distributions are unweighted. If the data contain weight variables, these will be found at the end of the variables list. In some cases frequency distributions have been substituted by descriptive statistics. Categorised responses to open-ended questions are not always included in the codebook. Distributions may contain missing data. The note "System missing (SYSMIS)" refers to missing observations (e.g. a respondent has not answered all questions) whereas "Missing (User missing)" refers to data the user has defined as missing. For example, the user may decide to code answer alternatives 'don't want to say' or 'can't say' as missing data.

The codebook may contain attached files, the most common one being the questionnaire.

Series description

City Service Surveys

City services have been studied since 1983. The surveys, conducted by the Association of Finnish Cities, and since 1993 by Efektia and Efeko (nowadays FCG Finnish Consulting Group), canvass citizens' attitudes towards municipal services and administration. The datasets are to a large extent comparable.

Abstract

The survey canvassed the citizens' views on the present state of city government and public services as well as developmental needs.

First, the respondents were presented with a set of attitudinal statements on municipal decision-making and services. Views on the organisation of information, health, social, education, and culture services in their municipality of residence were probed. In addition, services used by the respondents and their family members during the past year were canvassed. The respondents who had used municipal health services were asked how satisfied they had been with various aspects, such as getting an appointment, transport service, and the time of waiting at the reception. They were asked to select the most important development targets within the care of the elderly from alternatives such as old people's homes, municipal or private sheltered homes, and relative-assisted care of the elderly.

In view of municipal leisure services, the respondents were asked how many times they had used various services (e.g. library, movies and baths) in their municipality of residence or in other municipalities during the past year, and whether there were enough various leisure services (e.g. libraries, concerts, museums, sports events, restaurants and youth facilities) in their municipality of residence. They also rated their municipality's website. The respondents were presented with a list of problems related to coping with everyday life (e.g. unemployment, long-term lay-off, lack of time, illness or disability, and loneliness) and asked whether they or their family members had faced any of them and received or sought for help because of them.

The respondents were asked how long they had lived in their municipality of residence and residential area, what kind of a house and area they lived in, and what is the type of their accommodation. The respondents' satisfaction with their housing conditions and neighbourhood was also queried, as well as which factors affected their choice of residential area (e.g. good services, easy commuting, peacefulness of the area, and good chances of finding a job). The respondents were asked whether they felt safe walking in their neighbourhood or in the centre of their municipality during the day or at night, and how worried they were about becoming a victim of various crimes, such as theft, vandalism, or sex offence, in their municipality of residence.

The last questions revolved around child day care and children's school-going. The parents rated various characteristics of their children's kindergarten and school, including the co-operation between home and kindergarten/school, the proficiency of staff, and the size of groups/classes.

Background variables included the respondent's gender, age, municipality of residence, household composition, education, status in employment, and number of children.

1.3 Structure and collection of the data

Country: Finland

Geographic coverage: Finland, Espoo, Forssa, Helsinki, Hyvinkää, Järvenpää, Kemi, Kempele, Kokkola, Kouvola, Lahti, Lappi, Nurmijärvi, Oulu, Rauma, Rovaniemi, Tampere, Turku, Vaasa, Valkeakoski

Analysis or observation unit type: Individual

Universe: People aged 18-70 living in any of the participating towns/cities.

Collection date: May 2008 – June 2008

Data collector(s): Efeko

Data producer(s): Efeko

Mode of data collection: Self-administered questionnaire: Paper

Type of research instrument: Structured questionnaire

Time period covered: 2008

Time method of the data collection: Longitudinal: Trend/Repeated cross-section

Response rate: 35.9%

Number of variables and cases: The data contain 261 variables and 8664 cases.

Sampling procedure: Probability: Simple random

The size of the sample varied according to the number of inhabitants in the town/city. In each participating town/city, the respondents were randomly selected.

1.4 Use of data

Data appraisal

To prevent identification, variable bv1 indicating post code was removed from the data, and values 3 and over in the 'number of children' variable (bv7) were top-coded. In addition, variables bv2 (birth year), q13 and q14 (year of moving into the current residential area and municipality) were categorised.
